

Plant Floor Workstation (PFW)

Versona Systems presents the Plant Floor Workstation (PFW). The PFW was developed as a touchscreen workstation that allows for the deployment of standard Dell workstation to industrial environments. Over (800) of these workstations have been installed in industrial facilities around the world.

The engine inside the PFW is a standard Dell small form factor computer found on the "IT-approved" list of many companies. Versona packages the Dell in an enclosure built to NEMA 12 standards. The Dell rests on a sliding tray, which makes replacement of the computer a simple and quick process. The enclosure has external connections for power, Ethernet, serial ports, USB, and keyboard.

The PFW features a 17" SAW touchscreen that has proven to be very useful in the industrial environment.

The PFW has a standard VESA 100 mounting pattern on the back of the enclosure for wall mounting or for use with the adjustable height pedestal option.
